

SevaTrack — MeeSeva Citizen Registration Portal

A smart, React-based citizen registration system for streamlined e-governance. Developed with React.js, ES6, HTML5, CSS3 — deployed on Vercel.

Abstract

Government registration is often paper-heavy and slow. SevaTrack replaces manual procedures with a responsive web portal that supports secure citizen signup, client-side validation, accessible UI, and modular front-end engineering. The project showcases modern React practices and a deployable pipeline to support digital governance objectives.

Introduction

What is MeeSeva?

MeeSeva is a unified G2C platform delivering government services through a single portal.

SevaTrack Core Services

Citizen registration, secure authentication, profile management, responsive UI, accessibility-first navigation.

Primary benefits: reduced paperwork, faster onboarding, improved data quality and accessibility.

Problem Statement

Challenges

Manual data entry, long wait times, complex flows, data duplication, poor accessibility.

Why Change?

A centralized, accessible digital platform reduces admin burden and accelerates service delivery.

Proposed Solution

SevaTrack delivers:

- Online citizen registration with client-side validation
- Secure login and profile management
- Responsive, accessible UI with clear navigation
- Reusable React components and modular design

📋 Key advantages: faster access, fewer errors, lower admin overhead.

System Architecture

The architecture emphasizes component-driven UI, client-side validation, and a lightweight API layer for persistent storage. CI/CD deploys static frontend assets to Vercel.

React Component Flow & Virtual DOM

Component Model

App → Pages → Feature components (Registration, Login, Dashboard)
→ Reusable UI atoms.

Virtual DOM

State-driven rendering with diffing for efficient updates and minimal DOM mutations.

Technology Stack & Development Tools

Front-End

- React.js (Functional components & Hooks)
- JavaScript (ES6+), HTML5, CSS3
- React Router for client-side routing

Tools & Deployment

- VS Code, Git & GitHub
- Vercel for CI/CD and static hosting
- Vite (build & dev server)

Advantages: reusable components, rapid iteration, maintainable codebase, fast deployment pipeline.

State Management, Forms & Accessibility (CO2–CO5)

CO2: JavaScript & TypeScript Engineering

- Form validation, event handling, input processing
- ES6 arrow functions, useState closures, modular organization
- Files: Register.jsx, Login.jsx, Validation Functions

CO3: React Component Model

- Registration, Login, Dashboard components
- Deterministic UI functions, props, hooks
- Files: Register.jsx, Login.jsx, Dashboard.jsx

CO4: State Architecture & API Integration

- Form state, login state, user session data
- State co-location and event-driven updates
- Files: Register.jsx, Login.jsx, User Profile Components

CO5: Routing, Forms & Accessibility

- React Router, controlled forms, responsive design
- Dynamic navigation and accessibility features
- Files: App.jsx, Routes Configuration, CSS Responsive Styling

Build Systems, Testing & Deployment (CO6)

CO6: Build Systems, Testing, CI/CD & Deployment Engineering

- Project Build Process
- GitHub Repository Management
- Vercel Deployment Pipeline
- Vite for bundling and optimization
- Git for version control
- GitHub repository
- Vercel automated deployment
- Files: package.json, vite.config.js, GitHub Repository, Vercel Configuration

Build & Test Workflow

- Vite for fast dev builds and optimized production bundles
- ESLint + Prettier for code quality
- Unit tests for components (jest/React Testing Library)

Deployment

1. Push to GitHub
2. Vercel CI builds and previews
3. Automatic production deploy on main branch
